

Library Manager

A simple library manager, where you can view your collection and add or remove books accordingly.

A lot of the work will be done on the backend. The actual book lookup and DB management work will be done by [ISBN Lookup](#).

From there, the server backend will serve up book information, as well as an API to interact with the ISBN lookup tool.

Here is the desired layout:

Obviously quite rough, but thats the general main page idea.

When clicking on the link we will get a single book's page with more information.

We also need a portal to add or remove books from the database.

The API endpoints are yet to be determined but its going to be something like this

"/" will simply serve up all of the books in book json entry with a layout similar to:

```
{
  {
    "id": 1,
    "isbn": "19091830928390182",
    "title": "name of book",
    "authors": "authors of book",
    "year_of_publication": 1999,
    "page_length": 290
  },
  {
    ...
  }
}
```

And then "/book/[isbn]" will serve a single book.
